CSCE Case Study Project 100

2026

On Ver1.0

This document is the CSCE Evaluation Manual Ver1.0 (the Official Evaluation Manual).

It is the official specification that organizes CSCE Evaluation Engineering — established on the empirical foundation of Case001 through Case010 — so that third parties can carry out evaluations using the same procedure.

The role of this document is to define "how to evaluate." The history of how the theory took shape, and the detailed findings obtained through Case001–Case010, are organized separately in the companion volume, the CSCE Ver1.0 Release Notes.

Items marked "provisional" or [To Be Verified] in the text are research subjects for continued verification and revision from Ver2.0 onward.

All falsification conditions are provisional and will be revised as empirical research accumulates.

Introduction

This document is the official specification that defines the evaluation procedure of Civil Society Control Engineering (CSCE) in a form that third parties can actually use.

CSCE takes Principle Zero — human beings are not objects — as its foundational principle, and evaluates whether institutions, corporations, education, and other evaluands are designed to treat human beings as Subjects, through a structural analysis of three types of society: feudal, modern, and civil. This Evaluation Engineering was established inductively through the empirical research of Case001 through Case010.

The role of this document is limited to defining "how to evaluate." The record of how CSCE came to be established as a theory, and what was discovered through Case001–Case010, is organized separately as the "CSCE Ver1.0 Release Notes." Please consult it alongside this manual.

The intended readers are researchers, evaluators, policymakers, corporate practitioners, and educators who wish to apply CSCE to an actual evaluand. This is not a work of theoretical exposition but a procedural manual designed for implementation.

How to Read This Manual

Structure of This Manual

This manual consists of three parts and appendices. Part 1 is the theoretical section, defining "what to evaluate." Part 2 defines "how to evaluate" — the procedural section that forms the core of this manual. Part 3 defines the quality-control procedures that safeguard the integrity of evaluation. The appendices collect terminology, formats, and reference materials.

Notational Conventions

Notation	Meaning
[To Be Verified]	Indicates a statement not yet sufficiently substantiated or finalized.
"provisional"	Indicates a concept derived from a single case or a small number of cases, requiring re-verification from Ver2.0 onward.
"could not be confirmed"	Not an assertion that something "does not exist," but that it could not be confirmed within the present scope of observation (a limitation defined by Scope).

Recommended Reading Paths by Reader Type

Reader Profile	Recommended Path
First-time readers of CSCE	Read Ch.1 → Ch.2 → Ch.5 to grasp the overall picture, then proceed to the detail in Ch.6–8.
Practitioners who want to carry out an evaluation	Read Part 2 (Ch.5–8) in full, using Appendix B (Judgment Flowchart) and Appendix C (Evaluation Record Template) alongside it.
Researchers seeking to examine the theory's validity	Read the entire manual, then consult Appendix E (Case List), Appendix F (Concept Index), and Appendix G (Ver2.0 Research Agenda), reading alongside the CSCE Ver1.0 Release Notes.

Part 1 — CSCE Theory

Part 1 describes the theoretical foundation of CSCE as a two-layer structure. The first layer (Object Theory) defines "what to evaluate"; the second layer (Method Theory) defines "how to evaluate." Chapter 4 (Falsification Conditions) spans both layers and safeguards the theory's scientific character.

Official Evaluation Manual for Civil Society Control Engineering (CSCE)

Falsification conditions of the Object Theory

Falsification conditions of the Method Theory

Chapter 1 — What Is CSCE?

1.1 Definition

Civil Society Control Engineering (CSCE) is a theoretical system that takes Principle Zero — human beings are not objects — as its foundational principle, and, through a structural analysis of three types of society (feudal, modern, and civil), evaluates how actual institutions, policies, and AI outputs bear on the realization of human independence, equality, and freedom.

CSCE was developed by the Kushi Research Lab as research extending Numa Seiya's (沼正也) theory of civil law into AI governance, control engineering, and Kantian ethics.

A Note on the Term “Control”:

In CSCE, “control” does not mean domination or surveillance. It means identifying discrepancies between ideals and reality and improving institutional design through evaluation — the sense in which the term is used in control engineering and cybernetics: setting a goal, observing the present state, and correcting the gap between them.

1.2 The Two-Layer Structure of CSCE

Through the empirical evaluations of Case001 and Case002, it was confirmed that CSCE is developing not as a single theory but as a theoretical system consisting of two layers.

Layer	Name and Question	Main Content
First Layer (Object	Civil Society Control Engineering	Principle Zero · Three-Society Model ·

Theory)	(CSCE): what to evaluate	Independence → Equality → Freedom · Six Indicators of Objectification · Modern-Society Evaluation Criteria · Civil-Society Evaluation Criteria
Second Layer (Method Theory)	CSCE Evaluation Engineering: how to evaluate	Separation of observation and evaluation · Scope · Three-Layer Concept Check · Design Chain · Meta-Analysis · Deepening of the Question · the Ten-Step Procedure

These two layers are not independent theories; Evaluation Engineering developed naturally out of the Object Theory as the methodology for substantiating it. Their relationship can be shown as follows:

1.3 The Purpose of CSCE

The purpose of CSCE is not to prove the theory, but to test it.

- Reproducibility: that different evaluators applying the manual to the same case arrive at equivalent conclusions.
- Consistency: that the evaluation procedure remains uniform regardless of the type of case.
- Visibility of limits: that cases where CSCE cannot produce an answer are explicitly recognized as such.
- Self-improvement: that the accumulation of evaluations feeds back into revision of the CSCE theory itself.

1.4 Direction of Future Development

Through the empirical work of Case001 and Case002, CSCE Evaluation Engineering currently functions as a part of CSCE, but it may in the future stand as an independent field of research.

Name	English Name	Content
Civil Society Control Engineering	Civil Society Control Engineering (CSCE)	The Object Theory for understanding and designing society
Civil Society Evaluation Engineering (future)	Civil Society Evaluation Engineering (CSEE)	The Method Theory for evaluating and verifying society

At present, CSEE is treated as part of CSCE. Whether to establish it as an independent field of research will be considered after the accumulation of 100 case studies. [To Be Verified]

1.5 The CSCE Research Cycle

The research cycle below shows why CSCE aims for Case100. This cycle is self-improving: each case makes the next case more precise.

Conducting a Case Study (observation and evaluation from primary sources)

Discovery of new concepts / new patterns (deepening of the question)

Revision of the Evaluation Manual (Ver0.1 → Ver0.4 → Ver1.0 → ...)

Revision and refinement of CSCE theory (responding to falsification conditions)

On to the next Case Study (enabling more precise evaluation)

Establishment of an empirically grounded evaluation theory (CSEE)

Through this cycle, CSCE functions not as "deduction from a theory decided in advance" but as "an inductive research program that develops theory out of evidence."

Chapter 2 — Civil Society Control Engineering (Object Theory)

This chapter describes the Object Theory, which defines "what to evaluate." The Object Theory has continued since Ver0.4 and has been refined through the empirical work of Case001 and Case002.

2.1 Principle Zero

Principle Zero: Human beings are not objects. Human beings exist as Subjects of rights and duties, as persons of dignity. No institution, power, AI, or organization may treat a human being as an object existing solely for that institution's own purposes. Principle Zero is the highest-order principle of CSCE, and is the starting point for the Object Theory, the Method Theory, and the falsification conditions alike.

2.1.1 Kantian Grounding

Principle Zero is positioned as a transcendental argument corresponding to Kant's Formula of Humanity (the second formulation of the Categorical Imperative): "Act so that you treat humanity, whether in your own person or in that of any other, always at the same time as an end, and never merely as a means." This correspondence, however, is CSCE's own claim, and is treated as a falsifiable proposition. [To Be Verified]

2.1.2 The Operational Definition of Objectification (Six Indicators)

To make it possible to judge whether "a human being is being treated as an object," the following six indicators are established.

Indicator	Definition	Diagnostic Question
1. Exclusion from Decision-Making	A state in which the human beings affected are structurally unable to participate in the design, operation, or revision of an institution.	Are means of expressing opinion, filing complaint, and obtaining remedy institutionally guaranteed?
2. Denial of Irreplaceability	A state in which a human being is processed not as an individual person but as an interchangeable unit.	Is there structurally no room to take individual circumstances into account?
3. Externality of Purpose	A state in which a person's independence, equality, and freedom are perpetually and unconditionally subordinated to an external purpose.	Does the institution exist for the sake of the person, or does the person exist as a means to the institution's purpose?
4. Absence of Exit	A state in which the affected party has no reasonable means of leaving the institution.	Do alternatives, means of objection, exceptions, or remedy exist?
5. Erasure of Personhood	A state in which a person's particular character, history, and relationships are not taken into account in the institution's operation.	Is the person processed only by score or attribute, with the personal dimension excluded from consideration?
6. Availability of	Whether objection, review, correction, or	Does the remedy procedure

Remedy (auxiliary)	remedy is institutionally possible against a constraint or coercion.	function substantively? Is access to remedy equal?
--------------------	--	--

2.2 The Three-Society Model

CSCE grasps the structure of human society through the following three types. These are historical stages, and at the same time structural types that can coexist within an actual institution.

Society Type	Definition	Position as Breakwater or Goal
Feudal Society	A structure of personal subordination, status hierarchy, and domination by arbitrary power.	The direction of relapse (a state to be avoided).
Modern Society	A structure that places state power under the rule of law and recognizes the people as Subjects of rights and duties.	Breakwater (a minimum condition).
Civil Society	A structure that treats human beings as Subjects of dignity prior to institutions, moving toward the realization of independence, equality, and freedom.	The direction of the goal (the direction development should take).
The Breakwater Function of Modern Society: Modern society is not a completed ideal. Its essential role is to function as a breakwater against relapse into feudal society. Being "modern-society-like" is not the goal; it means securing the minimum condition on the way toward civil society.		

2.3 The Sequential Ordering: Independence → Equality → Freedom

CSCE holds that the realization of the three values in civil society follows a sequence. This ordering is a normative proposition, not a historical description.

Order	Explanation	Structural Problem if Absent
Independence (first)	A human being is released from personal subordination to another, to an institution, or to power.	Equality without independence remains merely the equalization of relations of domination. Freedom without independence becomes a privilege of the strong.
Equality (second)	An equal relation among independent Subjects.	Substantive equality becomes a live question only once independence is established.
Freedom (third)	Autonomous capacity for action realized on the basis of independence and equality.	Freedom without equality converts into a privilege of the strong.

2.4 The Five Criteria for Modern-Society Evaluation

Modern-society evaluation is a screening of minimum conditions, confirming whether feudal relapse is being prevented. Judgments are made on a four-way scale: Positive (actively contributing) / Non-Infringing / Undetermined / Infringing.

Criterion	Definition	Example of a Positive Judgment
Rule of Law	Is state power placed under the rule of law?	The institution actively strengthens the rule of law.
Popular Sovereignty	Does the institution substantively support popular sovereignty?	Institutional guarantees of elections and political participation.
Protection of the People	Does the state actively protect the people from feudal domination?	Guarantee of fundamental human rights; concretization of the public welfare.
Fundamental Human Rights	Does the institution concretely extend fundamental human rights?	Institutional expansion of rights; enrichment of remedies.
Prohibition of Self-Help	Does the institution uphold the principle prohibiting the taking of the law into one's own hands?	Institutionalization of adjudication, administrative remedy, and dispute resolution.

2.5 The Four Elements of Civil-Society Evaluation

Civil-society evaluation is the substantive evaluation of whether an institution is moving in the direction of civil society. It is judged on a five-level scale: High / Medium / Low / Undetermined / Regressive.

Element	Definition	Example of Empirical Observation
Human Dignity	Is the person treated as a Subject of rights and duties, as a person?	Whether the formation of dignity is positioned as an independent educational goal (Case001-2)
Independence	Is the person released from personal subordination?	Whether the formation of an independent Subject is designed for (Case001-2)
Equality	Is an equal relation among independent Subjects guaranteed?	The difference between formal and substantive equality (Case001, Case001-2)
Freedom	Is autonomous capacity for action, grounded in independence and equality, guaranteed?	Whether there is a design that cultivates an understanding of the grounds of freedom (Case002)

Empirical finding: across the three cases of Case001–Case002, the pattern of judgment for civil-society evaluation was common: "Human Dignity: Undetermined–Medium; Independence: Medium; Equality: Medium; Freedom: Medium–Undetermined." The meaning of this common pattern will be examined from Case001-3 onward. [To Be Verified]

Chapter 3 — CSCE Evaluation Engineering (Method Theory)

This chapter describes the Method Theory, which defines "how to evaluate." CSCE Evaluation Engineering is a methodology developed inductively from the empirical evaluations of Case001 through Case006, functioning as the means for substantiating the Object Theory (Chapter 2). Case004 and Case006 established the evaluation axes of Subject-Formation Coherence and Final Judgment Responsibility Coherence, along with the concept of Design Chain Integrity, completing the theoretical system of Evaluation Engineering.

3.1 The Five Principles of Evaluation Engineering

Principle 1: Separation of Description and Evaluation

Observation, classification, and analysis (the Descriptive Phase) are strictly separated from comparative analysis, evaluation, and proposal (the Evaluative and Proposal Phases).

Evaluative terms and analytic concepts must not be mixed into the Descriptive Phase.

Terms such as "chilling effect" and "discrepancy" belong to the vocabulary of the Analytic and Evaluative Phases.

Occasion of discovery: the contamination of "chilling effect" into Step 1 of Case001 (2025)

Principle 2: Deepening of the Question

The CSCE evaluation process functions not as "a device that produces answers" but as "a device that discovers questions."

Recording the change between the question at the start of an evaluation and the question at its end constitutes part of the evaluation's output.

Empirical examples:

Case001: "Does education policy realize sovereign-citizen education?" → "What is the formation of a sovereign Subject?"

Case001-2: "Do teaching materials convey a view of the human being and of society?" → "Are the concepts systematized?"

Case002: "Is AI literacy education sufficient?" → "What is AI literacy?"

Principle 3: Integrity of the Design Chain

In evaluating an institution, policy, or teaching material, each stage of the following Design Chain is confirmed. "Design Chain Integrity" refers to a state in which the chain from ideal to evaluation is made explicit and maintained. Where the chain is incomplete, it is recorded as a "Design Chain Gap" and further classified into two types: (1) a Structural Gap, where any of the links — ideal → concept → path to realization → attainment criterion → evaluation — is left unstated; and (2) a Sustaining Gap, where it has not been confirmed whether a designed institution can maintain, over time, the chain connecting Subject-formation and final judgment responsibility. Structural gaps were confirmed in Case001–004; sustaining gaps were confirmed for the first time in Case006.

Ideal (human-centeredness, human dignity, etc.)

↓ [grounds for the connection]

Concept (dignity, natural rights, AI literacy, etc.)

↓ [logical connection between concepts]

Path to realization (educational design, teaching method, etc.)

↓ [concretization of the design] Subject-formation (an independent Subject, subjective participation, etc.) ↓ [attainment criterion / evaluation method] Evaluation (confirmation of attainment) Empirical finding: a Design Chain Gap was confirmed in every case from Case001 through Case006 (Case001–004: structural gaps; Case006: a sustaining gap). (CSCE Meta-Analysis, First Round, 2025)

Principle 4: Scope of the Evaluand

At the outset of each case, the Scope of the evaluand is made explicit. What can be said within the Scope and what cannot be said outside it are distinguished. Questions falling outside the Scope are carried forward to a subsequent case.

Layer of Scope	What Can Be Evaluated	What Cannot Be Evaluated
Education policy (Case001)	The existence of institutional and legal grounding.	The content of teaching materials, teachers' understanding, educational effect.
Course of Study Guidelines (Case001-2)	The arrangement of concepts and the explicitness of goals, as a design document.	The actual connections among concepts; their treatment in the classroom.
AI guidelines / AI policy (Case002)	The ideals and arrangement of concepts, as a design document.	Actual classroom instruction; the degree of AI-literacy attainment.
Textbooks (substantiated in Case001-3 and Case009)	Concept-connection maps; the design of questions.	Teachers' interpretation; actual classroom treatment.

Principle 5: Self-Improving Cycle

The cycle of case execution → manual revision → the next case execution is built into the design. The manual itself is an evaluand and material for improvement. The evaluator is not a defender of CSCE but its examiner.

3.2 The Three-Layer Concept Evaluation

A principle of evaluation discovered from Case001-2. "A concept exists" and "a system of concepts exists" are different things. This distinction can be applied to every evaluand across education, AI, law, and policy.

Layer	Evaluative Question	Confirmation in Case001-2
Layer 1: Existence of the concept	Is the concept in question described?	"Human dignity," "the social contract," etc.: present
Layer 2: Connection among concepts	Is the logical relation among concepts made explicit?	The connection from human dignity to the social contract: not made explicit
Layer 3: Systematization of concepts	Do multiple concepts form a coherent structure?	A systematic arrangement of Axes A–D: absent

3.3 CSCE Meta-Analysis

CSCE Meta-Analysis is a method, unique to CSCE, of discovering patterns common across multiple cases. Rather than evaluating an individual case, it records the structures that Evaluation Engineering itself has discovered.

Note on terminology: "Meta-Analysis" here does not refer to the statistical aggregation of quantitative studies, as the term is often used in the social sciences. It refers instead to cross-case pattern analysis conducted within the CSCE framework.

The Three Conditions of Meta-Analysis

Confirmed Meta-Patterns (Ver1.0 Finalized — Case001–Case006)

3.3b Subject-Formation Coherence and Final Judgment Responsibility Coherence

These two axes, established through Case004 and Case006 respectively, evaluate whether an evaluand's design for cultivating human Subject-formation keeps pace as the evaluand itself (an AI system, an institution, etc.) grows more advanced and complex, and whether the final judgment responsibility of a human being is structurally preserved through the institution's operation over time.

3.4 Supplementary Guidance by Evaluand Type

3.5 Findings Obtained through Evaluation Engineering (Case001–Case006)

3.5 Overall Diagram of CSCE Theory (Summary)

Chapter 4 — Falsification Conditions and the Theory's Testability

For CSCE to function as a scientific theory, testability is required. This chapter makes explicit the falsification conditions for both the Object Theory (Ch.2) and the Method Theory (Ch.3). All falsification conditions are provisional and will continue to be revised as evidence accumulates.

The Meaning of a Falsification Condition:

A falsification condition is a criterion stating: "if this condition is satisfied, the corresponding CSCE proposition will be revised or rejected."

Making falsification conditions explicit is not a weakness of CSCE but a demonstration of its integrity as a scientific theory.

All falsification conditions are provisional and will be refined through the evidence accumulated from Case001-3 onward.

4.1 Falsification Conditions of the Object Theory

Proposition A: The Sequential Ordering of Independence → Equality → Freedom

Item	Content
Proposition	Unless independence is established, neither substantive equality nor freedom can be realized.
Falsification condition (proposed)	Three or more cases are confirmed in which freedom precedes an unestablished state of independence, and this persists functionally over time.
Direction of revision	Revise the ordering from a general proposition to a "conditional proposition," or refine the definition of the ordering itself.
Present status	No counter-example has been confirmed in Case001–Case002. No counter-example has been confirmed in subsequent cases either, including Case009 (textbook analysis).

Proposition B: Modern Society Is the Breakwater of Civil Society

Item	Content
Proposition	The establishment of modern-society institutions prevents feudal relapse and constitutes the minimum condition for the formation of civil society.
Falsification condition (proposed)	A case is confirmed in which civil-society-type Subject-formation is achieved and sustained even without modern-society institutions in place.
Direction of revision	Redefine the breakwater function of modern society as conditional, or revise the Three-Society Model itself.
Present status	No counter-example has been confirmed in Case001–Case002.

Proposition C: Principle Zero (Human Beings Are Not Objects)

Item	Content
Proposition	An institution, policy, or AI output that treats a human being as an object violates

	Principle Zero.
Falsification condition (proposed)	Multiple cases are confirmed in which a structure treating a human being as an object substantively improves that person's dignity, independence, equality, or freedom over the long term (e.g., medical paternalism producing long-term gains in autonomy).
Direction of revision	Refine, with greater precision, the distinction between "treating merely as a means" and "also treating as a means."
Present status	No counter-example has been confirmed in Case001–Case002. However, borderline cases have been identified — compulsory education, quarantine for infectious disease — and are being addressed through a two-stage judgment (screening → comprehensive judgment).

4.2 Falsification Conditions of the Method Theory

Proposition D: A Design Chain Gap Is an Evaluatively Significant Discrepancy

Item	Content
Proposition	An institution or teaching material in which the Design Chain is not made explicit carries a structural problem in Subject-formation.
Falsification condition (proposed)	Multiple cases are confirmed in which an institution or teaching material lacking an explicit Design Chain shows a higher Subject-formation effect than one in which the chain is explicit.
Direction of revision	Downgrade the Design Chain Gap from an "evaluatively significant discrepancy" to "a matter for observation."
Present status	Confirmed in common across the three cases of Case001–Case002. The relationship to educational effect is to be examined from Case001-5 onward.

Proposition E: The Three-Layer Concept Check (Existence, Connection, Systematization) Improves Evaluative Precision

Item	Content
Proposition	Distinguishing and evaluating the existence, connection, and systematization of concepts allows an institution's or material's design philosophy to be grasped more accurately.
Falsification condition (proposed)	No significant difference in final judgment is found between an evaluation applying the Three-Layer Concept Check and one that does not, across a substantial number of cases.
Direction of revision	Change the Three-Layer Concept Check from a required item to an auxiliary one.
Present status	Its effectiveness was confirmed through application in Case001-2, Case002, and Case009.

4.3 Policy for Managing Falsification Conditions

- All falsification conditions are updated continuously as cases accumulate.

- When a case meeting a falsification condition is identified, revision is not considered immediately; a revision decision is made only after the pattern has been reproduced across three or more cases.
- Revision of a falsification condition is itself subject to CSCE Meta-Analysis.
- The determination that "a falsification condition has been met" is made by the Kushi Research Lab. Claude presents falsification candidates; the final judgment is made by the researcher.

Part 2 — The Evaluation Procedure (The Ten-Step Method)

The Purpose of This Manual

Part 2 defines, in concrete and reproducible terms, the ten-step procedure by which a CSCE evaluation is carried out. Its purpose is to allow different evaluators to reach comparable conclusions when applying the same procedure to the same evaluand.

The Evaluator's Basic Posture

The evaluator does not begin from a predetermined conclusion. Observation, classification, and analysis are kept rigorously separate from evaluation and proposal. The evaluator treats CSCE itself as an object of scrutiny rather than something to be defended.

Chapter 5 — Overview of the Ten-Step Evaluation Procedure

5.1 The Structure of the Three Phases

The ten-step procedure is divided into the following three phases. This division is essential for reducing the risk that an evaluator's preconceptions contaminate the descriptive stage.

Phase	Steps	Purpose
Descriptive Phase	1. Observation 2. Classification 3. Analysis	Describe the facts. Evaluation is withheld at this stage.
Evaluative Phase	4. Comparative Analysis 5. Primary Evaluation 6. Secondary Evaluation 7. Discrepancy Detection 7a. Principle Zero Re-Evaluation	Apply the three evaluative focuses and discover contradictions and discrepancies.
Proposal Phase	8. Proposal 9. Critique 10. Final Proposal	Present the Sollen (what ought to be) and make explicit the limits of the evaluation.

5.2 The Three Evaluative Focuses and Their Cross-Reference

In the Evaluative Phase, the following three evaluative focuses are applied. The three focuses are not a fixed hierarchy but perspectives that can cross-reference one another. The theoretical starting point is placed at Principle Zero evaluation.

The Three Evaluative Focuses:

- A. Principle Zero Evaluation (the root principle: is the human being an object or not?)
- B. Modern-Society Evaluation (minimum-condition screening: is relapse into feudalism being prevented?)
- C. Civil-Society Evaluation (the substantive evaluation of developmental direction: is movement toward civil society occurring?)

Principle of Cross-Reference:

A result of "regressive" in Civil-Society Evaluation may prompt reconsideration of Principle Zero Evaluation.

In that case, Principle Zero Re-Evaluation is carried out at Step 7a.

Chapter 6 — Observation, Classification, Analysis (Descriptive Phase: Steps 1–3)

6.1 Step 1: Observation

Identify and describe, from primary sources, the concrete institution, provision, policy, or act that constitutes the evaluand.

Item	Content
Input	Primary sources: statutes, policy documents, administrative guidance, news reporting, AI responses, etc.
Output	Identification and description of the concrete institution, provision, or act to be evaluated.
Prohibited	No evaluation, classification, or judgment is made at this stage.
Cautions	Cite and reference primary sources explicitly. Avoid relying solely on secondary sources. Analytic concepts (terms involving causal inference or evaluative content) must not be used in observational description — e.g., "chilling effect" or "dysfunction" are analytic/evaluative concepts, to be used from Step 3 onward. At Step 1, description should be limited to formulations such as "a research report states that..." or "a tendency has been observed whereby...." [Ver0.2 addition] As a precondition for evaluation, the "Evaluating Party" (who is evaluating) and the "priority order of applied evaluation criteria" are made explicit in the basic-information field. The evaluating party itself may also become an object of CSCE-type evaluation.

6.2 Step 2: Classification

Classify the observed results according to the operational definitions (Chapter 3). Evaluation is not yet performed.

Item	Content
Input	The observational results from Step 1.
Output	An enumeration of modern-society-type elements, an enumeration of civil-society-type elements, and identification of the type of coercion involved.
Definitions applied	The operational definitions of Chapter 3 (3.1–3.4).
Handling of composite institutions	Where an institution cannot be classified simply, describe it as a "composite structure" and enumerate both sets of elements. Descriptions involving comparison, causation, or possibility are deferred to Step 3 onward. Outcome data for an institution (voting rates, implementation rates, etc.) are used at Step 4 (Comparative Analysis). Step 2 is limited to enumerating institutional elements. [Ver0.2 addition] Add "signs of feudalization" as a classification axis. Where personal subordination, status hierarchy, arbitrary power, or the priority of domination is observed, record it separately from modern-society-type and civil-society-type elements. [Ver0.4 addition] Where AI or technology is the evaluand, add Axis E (View of AI). Definition of Axis E: description concerning what AI is, its limits, its role, and the division of roles between humans and AI. Distinction from Axis B (View of the Human Being): B asks "what is a human being?"; E asks "what is AI, and what is its role?" A description in which both axes are present is decomposed as a composite concept.

6.3 Step 3: Analysis

Describe the structural relations among the classified elements. Make explicit any causal relation, interdependence, or contradiction.

Item	Content
Input	The classification results from Step 2.
Output	A structural description of the four-layer model (institution, operation, Subject, outcome), described using five criteria (causation, interdependence, constraint, contradiction, absence). [Ver0.3 addition] Confirm separately the existence of a concept, the connection among concepts, and the systematization of concepts (the Three-Layer Concept Check): (1) Existence of the concept: is it described? (2) Connection among concepts: is the logical relation among concepts made explicit? (3) Systematization of concepts: are multiple concepts presented as a coherent system? [Ver0.4 addition] Rule for analyzing composite concepts: where a single description involves multiple classification axes (B, C, D, E, etc.), the axes are not changed; instead, each constituent element is decomposed and analyzed separately. Ambiguity in a classification axis is distinguished from a single description spanning multiple axes. Example: "subjective participation in the information society" is decomposed into "information society (Axis C: view of society)" and "subjective participation (Axis D: Subject-formation)."
Prohibited	Description is limited to structure; evaluation (judgments such as good/bad) is not made.
Cautions	An expression of the form "X ought to be done" is Sollen (what ought to be) and is deferred to the Proposal Phase. Outcomes (Layer D) are treated as structural description; evaluation of outcomes (judgments such as good/bad/failure) is made from Step 5 onward. Objects of analysis: A. institution (primary), B. operation (primary), C. Subject (secondary), D. outcome (secondary). Criteria of analysis: causal relation, interdependence, constraint relation, contradictory relation, absence.

Chapter 7 — Evaluation and Discrepancy Detection (Evaluative Phase: Steps 4–7a)

Before entering the Evaluative Phase, the three-stage distinction within CSCE's evaluation methodology is made explicit.

The Three-Stage Distinction within CSCE's Evaluation Methodology

Analysis (Step 3) = describes structure. It describes what relations hold among the four layers — institution, operation, Subject, outcome. It carries no directionality.

Comparative Analysis (Step 4) = describes difference. It describes differences among structures, among layers, and across time, and extracts the issues necessary for evaluation. This step gives directionality to the structural description and functions as a buffer layer between the Descriptive and Evaluative Phases. Comparative analysis does not itself evaluate the structure.

Evaluation (Steps 5–7) = gives meaning to difference. It determines what significance a discovered difference carries when measured against Principle Zero, the modern-society criteria, and the civil-society criteria.

This three-stage separation reduces the risk of the evaluator's own values contaminating the structural and differential description, and secures reproducibility.

7.1 Step 4: Comparative Analysis

The purpose of Step 4 is to discover, within the structure described in Step 3, evaluatively significant differences, absences, and reversals, and to identify the issues for the Evaluative Phase (Steps 5–7). Evaluative terms such as "good/bad, success/failure" are not used.

Item	Content
Input	The analytic results of Step 3.
Output	A list describing the results of a triangular comparison (institution vs. operation, institution vs. outcome, operation vs. outcome) under five categories: correspondence, difference, absence, reversal, unconfirmed.
Axes of comparison	Comparison ①: institutional purpose vs. actual outcome (Layer A vs. Layer D). Comparison ②: institution vs. operation (Layer A vs. Layer B). Comparison ③: comparison over time (carried out with an explicit starting point). Comparison against CSCE criteria (Comparison ④) is applied in the Evaluative Phase, Steps 5 and 6.

[The Five Categories of Output] The results of comparative analysis are described under the following five categories: (1) Correspondence: the compared elements A and B align. (2) Difference: a divergence exists between A and B. (3) Absence: an element presupposed to exist — by institutional purpose, statutory language, or another point of comparison — cannot be confirmed at the layer in question. (4) Reversal: an outcome opposite in direction to the institutional purpose is observed. (5) Unconfirmed: the data needed for comparison are insufficient to judge. [Prohibited] Evaluative terms such as "good/bad, success/failure" are not used. Comparison against CSCE criteria (independence, equality, freedom, etc.) is carried out at Steps 5 and 6.

7.2 Step 5: Primary Evaluation (Modern-Society Evaluation)

As a minimum-condition screening, modern-society evaluation is carried out for the five criteria of §3.1.

Item	Content
Input	The comparative-analysis results of Step 4.
Output	A positive/negative judgment result for each of the five criteria.
Judgment format	For each criterion, one of four categories: Positive (actively contributing) / Non-Infringing (a neutral confirmation of non-infringement, not a negative evaluation — the term "Negative" is retired) / Undetermined / Infringing. [Ver0.5 addition] The degree of legal binding force is made explicit as a factor in setting confidence: hard law (with penalties) → confidence: high; an intermediate soft/hard case (statute without penalty) → confidence: medium; soft law (guidelines, voluntary measures) → confidence: low–medium. A Positive judgment is qualified with a scope-limiting phrase such as "as institutional design" or "as a legal framework." [Ver0.6 addition] Relation to final judgment responsibility: a field is added to record, in one line, how each criterion's evaluative rationale relates to final judgment responsibility (accountability, correctability, agency, sustainability). Points to record: (1) which condition of final judgment responsibility this criterion corresponds to; (2) what, from the standpoint of final judgment responsibility, remains to be additionally confirmed. Mandatory for cases addressing Human Oversight; optional otherwise. [Ver0.3 addition] The way the five criteria manifest differs by evaluand type (law, policy, teaching material, AI output, judicial precedent, administrative operation). The evaluand type is made explicit in the basic-information field, and the policy for applying the five criteria is confirmed in advance. [Ver0.5 addition] Cross-layer Design Chain evaluation: where the evaluand spans multiple layers (ideal, statute, guideline, etc.), Step 4 (Comparative Analysis) confirms the correspondence of core concepts (human dignity, Subject-formation, etc.) across layers. Points to confirm: (1) inheritance of the concept (is the upper layer's concept carried through to the lower layer?); (2) explicitness of the connection (is the logical connection between layers explained?); (3) consistency of the attainment criterion (is the attainment criterion coherent at each layer?). [Ver0.7 addition] Principle of design conversion: "An evaluative element present in institutional design must be converted, without interruption, into operational practice, education, confirmation indicators, and attainment criteria at the stage of preparing for operation. An evaluative element that is not converted risks being lost at the operational stage." (Discovered in Case007.) In comparative analysis, a five-column design-conversion table (design element → operational preparation → education/training → confirmation indicator → attainment criterion) is used to record the state of conversion. Confirm whether each column is filled; an empty column is recorded as "conversion unconfirmed."
Screening result	If the minimum conditions of modern society are met → proceed to Step 6. If a significant absence is found → proceed to Step 6, appending a description of it.

7.3 Step 6: Secondary Evaluation (Civil-Society Evaluation)

As the substantive evaluation of developmental direction, a five-level evaluation is carried out for the four elements: human dignity, independence, equality, and freedom.

Item	Content
Input	The evaluation results of Step 5.
Output	A five-level evaluation (High / Medium / Low / Undetermined / Regressive) for each of the four elements.

Judgment format	The five-level scale of §3.2 applied to each element.
Cautions	An element judged "Regressive" becomes the object of discrepancy analysis at Step 7. "Undetermined–Medium" is recorded as "Undetermined," with the reasoning noted in the remarks field (Ver0.2 provisional handling). [Ver0.3 addition] When evaluating a design document, clearly distinguish "what can be said from the design" from "what cannot be said from the design." Evaluation of a design document is confined to the scope of the design; operation and effect are carried forward to a subsequent case. [Ver0.5 addition] Auxiliary evaluation item: Subject-Formation Coherence. Definition: evaluates whether, as an evaluand — an AI technology, an institution, etc. — grows more advanced and complex, the corresponding design for human Subject-formation is strengthened to match. Judgment: correspondence present (explicit) / partial (partially addressed) / insufficient (not explicitly designed) / unconfirmed. Application: used in AI- and technology-policy cases. Provisionally adopted following trial application in Case004. Judgment phrasing: "correspondence present (explicit)," "partial (partially addressed)," "could not be sufficiently confirmed (not explicitly designed)," "unconfirmed." The categorical term "absent" is not used; instead, "could not be confirmed" is used, calibrated to Scope. [Ver0.6 addition] Auxiliary evaluation item: Final Judgment Responsibility Coherence. [Ver0.7 addition] Auxiliary evaluation item: Transition Coherence (provisional; to be re-confirmed from Case008 onward). Definition: an axis evaluating whether, in the process of moving from institutional design to operational readiness, the human being's final judgment responsibility guaranteed at the design stage is converted, without interruption, into operational procedures, confirmation indicators, education, and audit logs. The five-column design-conversion table is used to record the conversion status of the four conditions (accountability, correctability, agency, sustainability). Judgment: conversion present / partial conversion present / could not be confirmed from public documents / unconfirmed. Application: used in cases addressing Human Oversight, AI governance, and the transitional period of institutional implementation; also applicable to corporate governance documents. Definition: evaluates whether a mechanism called Human Oversight is designed in a way that can actually sustain a human being's final judgment responsibility (the four conditions: accountability, correctability, agency, sustainability). Judgment: recorded per condition as "explicit," "partial," "could not be confirmed," or "unconfirmed." Application: used in cases addressing the sustainability of Human Oversight, AI governance, and institutional design. Provisionally adopted following trial application in Case006. Human Oversight is positioned not as an independent evaluative principle but as a means for institutionally realizing Final Judgment Responsibility Coherence.

7.4 Step 7: Discrepancy Detection

Cross-check the results of modern-society evaluation and civil-society evaluation, and identify discrepancies, contradictions, and divergences. [Ver0.6 addition] Two categories of Design Chain Gap: where a Design Chain Gap is confirmed, it is recorded under one of two categories: (1) a Structural Gap, where the chain — ideal → concept → path to realization → attainment criterion → evaluation — is left unstated; or (2) a Sustaining Gap, where it has not been confirmed whether the designed institution can maintain, over time, the chain connecting human Subject-formation and final judgment responsibility. Parent concept: Design Chain Integrity (Ver1.0). [Ver0.7 addition] (3) A Transition Gap (provisional; to be re-confirmed from Case009 onward): a state in which, in the process of converting a design obligation into operational practice (confirmation indicators, education, procedural manuals, etc.), no institutional mechanism exists to confirm the completeness of that conversion. This is recorded in particular as a "gap in the conversion of agency" (a state in which agency alone, among design obligation → operational practice → confirmation indicator → attainment criterion, is converted at none of these stages). This was observed both in Case007 (the institutional side) and Case008-A (a

corporation's public documents) (a structural hypothesis; whether to theorize it is to be decided upon integrative verification in Case009).

Item	Content
Input	The evaluation results of Steps 5 and 6.
Output	A list of discrepancies; a list of unconfirmed matters (kept in a separate field from discrepancies); a structural description of any contradiction; a determination of whether Principle Zero Re-Evaluation is required; CSCE Meta-Analysis (recorded where a pattern common across multiple cases is discovered). [Ver0.4 addition] Add "a gap in the Design Chain" as a fourth type of discrepancy: a state in which any link in the chain — ideal → concept → path to realization → attainment criterion → evaluation — is left unstated. Where this is confirmed as a cross-cutting pattern spanning multiple cases, rather than a defect of an individual case, it is recorded in the CSCE Meta-Analysis field.
Types of discrepancy	Modern-society conditions satisfied but civil-society evaluation regressive / civil-society evaluation favorable but modern-society conditions absent / other.

7.5 Step 7a: Principle Zero Re-Evaluation (Conditional)

Carried out only where a discrepancy identified at Step 7 is judged to bear on Principle Zero.

Trigger Conditions for Principle Zero Re-Evaluation: Step 7a is carried out if any of the following applies: • Civil-society evaluation has found a "regressive" result, and multiple indicators among the six indicators of objectification are met. • A criterion judged "Infringing" in modern-society evaluation bears directly on human agency. • Multiple flags for a possible Principle Zero violation have been raised throughout the Evaluative Phase.	
Item	Content
Input	The discrepancy list from Step 7, plus the six indicators of objectification.
Output	The final determination of a Principle Zero violation (violation / no violation / judgment reserved).
Judgment format	The two-stage judgment of §2.4 applied.
Note	"Judgment reserved" is actively recorded as a limit of CSCE.

Chapter 8 — Proposal, Critique, and Final Proposal (Proposal Phase: Steps 8–10)

8.1 Step 8: Proposal

Based on the evaluation results, present a direction for institutional improvement. Sein and Sollen are clearly distinguished.

Item	Content
Input	The complete results of the Evaluative Phase.
Output	A concrete improvement proposal (policy, institution, procedure, etc.).
Formal requirement	Sein (the observed reality) and Sollen (the proposed ideal) are described in explicitly distinct terms.
Prohibited	No proposal is made without evaluative grounding.

8.2 Step 9: Critique

Critique is directed at the CSCE framework itself. This is self-critique — a step that actively makes explicit the theory's limits.

Step 9 is not "an objection to the evaluation" but "an objection to the evaluative framework."

Questions to be asked:

- Did CSCE overlook any perspective in this evaluation?
- Would the evaluation change if viewed from a different theoretical framework (utilitarianism, liberalism, etc.)?
- Was there any problem with the operational definitions used in the evaluation?
- Were there points where CSCE's concepts were difficult to apply to this case?
- Was applying CSCE to this case appropriate to begin with? Might a different evaluative framework have been more effective (a critique of the evaluative criteria themselves)?
- Do the individuals or organizations operating this case possess an understanding of civil society (an evaluation of civil-society literacy)?
- If the problem this evaluation reveals is left unaddressed, what will be passed on to the future (an evaluation of what is carried forward)?

8.3 Step 10: Final Proposal

Integrate the proposal of Step 8 with the critique of Step 9, and present a final proposal with its reservations made explicit.

Item	Content
Input	The proposal of Step 8 plus the critique of Step 9.
Output	A final proposal with its reservations made explicit.
Where "no answer" results	State explicitly that no answer was reached, and record the reason (see Chapter 10).
Form of the reservation	"This proposal is based on CSCE's evaluation as of the present time, and presupposes [specific limitation]."

Part 3 — Quality Control of Evaluation

Chapter 9 — Ensuring Reproducibility

9.1 The Independent Evaluation Protocol

Verification of reproducibility is carried out by the following procedure.

- Multiple evaluators (or separate AI sessions) each carry out an independent evaluation of the same case, referring only to this manual.
- Each evaluator completes all ten steps without seeing the results of the other evaluators.
- Upon completion, the judgment results of each step are cross-checked.
- Discrepancies are recorded and analyzed according to the classification in §9.3.

9.2 Criteria for Measuring Agreement

The following criteria establish what counts as "reproduced."

Object of Measurement	Criterion	Explanation
Principle Zero judgment	Complete agreement	Agreement among the three categories: violation / no violation / judgment reserved.
Modern-society evaluation	Agreement per criterion	Agreement in the judgment for each of the five criteria.
Civil-society evaluation	Agreement per element	Agreement in the five-level evaluation for each of the four elements.
Discrepancy detection	Agreement of type	Agreement on the existence and type of discrepancy (exact agreement of content is not required).
Final proposal	Agreement of direction	Agreement on the direction of the proposal (differences of wording are tolerated).

9.3 Classification of Disagreement

Disagreement among evaluators is classified and recorded under the following three types.

Type of Disagreement	Meaning and Response
Manual Deficiency	Interpretation differs among evaluators because an operational definition, judgment criterion, or procedure is unclear. → Treated as a subject for manual revision.
Theoretical Ambiguity	The CSCE concept itself admits multiple interpretations. → Recorded as material for revising the theory.
Evaluator Misreading	The manual is clear, but the evaluator applied it incorrectly. → The cause of the misreading is identified, and the manual's wording is reinforced.

Chapter 10 — Making Limits Explicit

10.1 Types of Cases Where CSCE Cannot Produce an Answer

In the following cases, the fact that "no answer results" is actively recorded. This is not a failure of CSCE but the theory's honest self-recognition.

- Value-Equilibrium Cases: cases in which multiple values — such as individual freedom and collective security — are in equilibrium, and CSCE's framework cannot determine a priority among them.
- Cases of Mixed Society-Types: cases in which feudal, modern, and civil-society elements are intricately mixed within a single institution, making an overall evaluation difficult.
- Cases where the scope of Principle Zero's application is unclear: cases in which the boundary of "human being" (AI, the unborn, future generations, etc.) or the degree of objectification is difficult to judge.
- Cases of insufficient data or information: cases in which the primary sources needed for observation are unobtainable, and the Descriptive Phase cannot be completed.
- Cases of rapid change: cases in which the institution or social situation changes during the course of evaluation, producing a divergence between observation and evaluation. Cases of teaching-material or operational-practice evaluation: cases in which evaluation of the institution can be completed, but the actual content of teaching materials, teacher training, and Subject-formation fall outside the institution's scope. In such cases the matter is carried forward to a subsequent case (e.g., Case001-2).

10.2 Handling Value-Equilibrium Cases

Where values are in equilibrium, CSCE proceeds as follows.

- Describe the grounds on which the values are judged to be in equilibrium.
- Describe each side of the equilibrium in terms of CSCE's own concepts (dignity, independence, equality, freedom).
- Describe the consequence of prioritizing either value.
- Record CSCE's determination as "final judgment reserved due to value equilibrium," stating this explicitly at Step 10.

10.3 The Provisionality of Evaluation Results

Every CSCE evaluation result is provisional.

An evaluation result depends on the operational definitions in force, the information available, and the evaluator's interpretation at the time of evaluation.

An evaluation result may be revised by a manual revision, new information, or the development of the theory.

This provisionality is not a defect but a demonstration of the integrity of CSCE evaluation.

Appendices

Appendix A — Glossary (List of Operational Definitions)

Term	Operational Definition
Principle Zero	Human beings are not objects. Human beings exist as Subjects of rights and duties, as persons of dignity.
Objectification	The structure by which a human being is severed from the standing of a Subject of rights and duties and a person of dignity, and treated as an object existing solely for the purposes of an institution, power, capital, or organization. Judged by the six indicators.
Negation of Agency	A state in which a human being's judgment, choice, and action concerning their own circumstances are institutionally and structurally blocked.
Modern-society-type	An institution, policy, or act that functions to prevent relapse into feudal domination. Judged by the five criteria (rule of law, popular sovereignty, protection of the people, fundamental human rights, prohibition of self-help). Judgment is made on a four-way scale: Positive (actively contributing) / Non-Infringing (a neutral confirmation of non-infringement) / Undetermined / Infringing.
Civil-society-type	An institution, policy, or act that treats a human being as a Subject of dignity prior to institutions, and contributes to the realization of independence, equality, and freedom. Judged by a five-level evaluation of the four elements.
Coercion that Gives	Coercion that restores or extends independence, equality, or freedom by giving support to a person in a weak or subordinate position.
Coercion that Takes Away	Coercion that takes excessive power away from a ruler or the strong, protecting the equality and freedom of others.
Infringement of Human Dignity	An institutional or structural state in which a human being is treated not as a Subject of rights, duties, and personhood, but as an object of possession, domination, use, management, or exclusion.
Sein	The observation and description of reality. The object of the Descriptive Phase.
Sollen	The proposal of what ought to be. The object of the Proposal Phase. Sein and Sollen are clearly distinguished.

Appendix B — Judgment Flowchart

The following is a simplified flow for judging a Principle Zero violation.

STEP 1: Check the six indicators of objectification. → One or more apply: raise a flag for possible violation. → None apply: no Principle Zero violation (record and conclude). STEP 2 (if flagged): Comprehensive judgment → Is remedy available (Indicator 6)? → How many indicators apply, and how serious are they?

→ What is the persistence, irreversibility, and institutional grounding?

STEP 3: Judgment

→ Violation confirmed / no violation / judgment reserved (record the reason).

Appendix C — Evaluation Record Template

The evaluation record for each case is prepared in the following format.

Item	Content to Record
Case Number	Case000–Case099
Case Title	In the form "Does [evaluand] [question]?"
Date of Evaluation	YYYY-MM-DD
Evaluator	Name or AI-session identifier
Evaluating Party [Ver0.2]	The name, organization, or AI-session identifier of the evaluating party. The evaluating party itself may also become an evaluand from the standpoint of civil-society literacy. [Ver0.4 addition] The Scope of the evaluand is made explicit in the basic-information field: which layer — (1) policy (statute/institution), (2) Course of Study Guidelines/design document, (3) textbook/teaching material, (4) classroom practice, or (5) educational effect — is being evaluated is determined in advance, and anything outside that scope is recorded as "not evaluated (carried to a subsequent case)."
Applied Evaluation Criteria [Ver0.2]	The evaluation criteria given priority in this case (e.g., centering on modern-society evaluation / prioritizing Principle Zero evaluation). The criteria themselves are fixed by the manual, but making the emphasis explicit improves reproducibility.
Primary Sources	A list of the sources consulted.
Steps 1–3	The record of the Descriptive Phase.
Steps 4–7a	The record of the Evaluative Phase (including the judgment result of each step).
Steps 8–10	The record of the Proposal Phase.
Limits of CSCE	The points at which CSCE could not produce an answer in this evaluation.
Proposed Manual Revisions	Improvements to the manual discovered through this case.

Appendix D — Supplementary Guidance by Evaluand Type

This appendix consists of two sections. D.1 gives general supplementary guidance according to the type of evaluand (institution, corporation, education, etc.). D.2 gives a five-layer model specific to the field of education.

D.1 Supplementary Guidance by Type of Evaluand

The way CSCE's five criteria manifest, and the emphasis of evaluation, differ according to the type of evaluand. The following supplementary guidance is drawn from the empirical work of Case001–Case002.

Evaluand	Evaluative Emphasis	Distinctive Considerations	Corresponding Case
Education policy (statute/institution)	The divergence between the institution's existence and Subject-formation	Whether legal grounding exists; the definition of attainment criteria; the gap between institutional development and capability-formation	Case001
Course of Study Guidelines / design documents	The divergence between the existence of concepts and their connection/systematization	Identifying the central concept; classification into the four axes (A–D); evaluation of the design philosophy	Case001-2
AI guidelines / AI policy	The connection between human-centered principle and educational content	Addition of Axis E (View of AI); the positioning of the human-centered principle; the definition of AI literacy	Case002
Textbooks / teaching materials	Evaluation of the conversion from design to implementation	Application of concept-connection maps, historical-connection maps, and question design (Case000.8)	Case001-3 (planned)
Law / judicial precedent	Legal agency, availability of remedy, concretization of rights	Prohibition of self-help; the substance of legal remedy; judgment of Principle Zero violation	To be added
AI response / AI output	Whether the human being is treated as a Subject; the quality of concept connection	Axis E; the six indicators of objectification; the Three-Layer Concept Check; question design	To be added

Note: this supplementary guidance is drawn inductively from Case001 through Case008-A and will be revised as further cases accumulate. Where an evaluand spans multiple layers, the primary evaluand is made explicit in the Scope field, and secondary evaluands are carried forward to subsequent cases. [Ver0.7 addition] Corporate governance documents (System Cards, Responsible Scaling Policies, Frontier Safety Frameworks, etc.) are formally added as an evaluand type. The qualifying phrase "as corporate governance design" is used, clearly distinguished from "as institutional design." Since corporate documents carry no legal binding force, care is required in setting the confidence level.

D.2 The Five-Layer Model of Educational Evaluation

Through the empirical evaluations of Case001 and Case001-2, it was found that CSCE evaluation in the field of education can be systematized into the following five-layer structure. Each layer is an independent evaluand, and evaluation of a later layer presupposes evaluation of the layer before it. This five-layer structure may also be applicable, as a general principle for stratifying evaluands in CSCE evaluation, to fields beyond education.

Layer	Evaluand	Evaluative Question	Corresponding Case
Layer 1	Education policy	Is sovereign-citizen education institutionally established?	Case001 (complete)
Layer 2	Course of Study Guidelines	Does it provide institutional knowledge of modern society and design for Subject-formation?	Case001-2 (complete)

Layer 3	Textbooks	How does it concretize the concepts and goals of the Course of Study Guidelines?	Case001-3 (planned)
Layer 4	Classroom practice	How do teachers handle the view of the human being, the view of society, and Subject-formation?	Case001-4 (planned)
Layer 5	Educational effect	To what extent is sovereign-citizen formation actually achieved?	Case001-5 (planned)

Appendix E — Case List

Case	Evaluand	Principal Finding	New Concept(s)
Case001	Japanese education policy / sovereign-citizen education	Evaluation is "a device that discovers questions."	Deepening of the Question
Case001-2	Course of Study Guidelines, "Civics"	The existence, connection, and systematization of concepts are distinct dimensions.	Three-Layer Concept Check; Five-Layer Model of Educational Evaluation
Case004	AI policy / human dignity (three-layer structure)	It could not be confirmed that Subject-formation design was sufficiently made explicit.	Subject-Formation Coherence; Cross-Layer Design Chain Evaluation
Case006	Human Oversight (EU AI Act / Anthropic)	Designed as a safety mechanism, but not made explicit as a means for realizing final judgment responsibility.	Final Judgment Responsibility Coherence; the two-way classification of Design Chain Gaps
Case007	The state of readiness for GPAI regulation	Agency alone, among the elements, is not converted.	Principle of Design Conversion; the Gap in the Conversion of Agency; Transition Coherence
Case008-A	Corporate governance of three major AI providers	A common gap in the conversion of agency was observed on both the institutional and corporate sides.	Demonstration of the general applicability of Evaluation Engineering; Oversight Coherence
Case009	Tokyo Shoseki's "Civics 701" textbook	Rich in the ideal of cultivating an independent Subject of personhood, but no design for making the process of judgment visible could be confirmed.	Judgment-Formation Coherence
Case010	Integrative verification of Case001–009	Discovery of CSCE's three-layer structure and the structural limits of self-evaluation.	The CSCE Three-Layer Structure; the Subject-

			Transformation Pattern (provisional)
--	--	--	--------------------------------------

Appendix F — Concept Index (Established / Provisional)

Established Concepts

Concept	Case of Establishment
Principle Zero	Case000.9 through all cases
The Ten-Step Evaluation Procedure	Case001–003
Modern-Society Evaluation (Five Criteria)	Ver0.1 onward
Civil-Society Evaluation (Four Elements)	Ver0.1 onward
Subject-Formation Coherence	Case004
Final Judgment Responsibility Coherence (Four Conditions)	Case006
Design Chain Integrity (Structural Gap / Sustaining Gap)	Case006–007
Principle of Design Conversion	Case007

Provisional Concepts (to be verified from Case010 onward)

Concept	Case Proposed
Transition Coherence	Case007
Transition Gap	Case007
Oversight Coherence	Case008-A
Judgment-Formation Coherence	Case009
Principle One (Human beings are not gods. Nor is AI.)	Case009 (dialogue with ChatGPT)
Operational Complementarity	Theoretical dialogue related to Case009
The Subject-Transformation Pattern	Organized across Case007, 008-A, 009, and Case010
Institutional-Succession Coherence	Case000.9, Case006 (a Ver2.0 research topic)

Appendix G — The Ver2.0 Research Agenda

Ver1.0 declares the completion of the theoretical system; it does not mean the theory's final and definitive settlement. The following research topics are recorded as matters for continued verification from Ver2.0 onward.

G.1 Institutional-Succession Coherence

Definition (provisional): a meta-evaluative axis assessing whether Subject-Formation Coherence and Final Judgment Responsibility Coherence are maintained over time.

Occasion of discovery: this idea was conceived from the contrast between the temporal qualification "current period of AI development" in the Anthropic Constitution (observed in Case006) and the permanent institutions of the EU AI Act.

G.2 The Theory of the Evaluating Party

Among the four-way classification established in Case000.9 (Subject of rights, object of protection, evaluating party, evaluand), the task of refining the typology of the "evaluating party" (researcher, court, administrative agency, citizens' committee, etc.). To be established once, through the accumulation of cases, "who evaluates" becomes a significant question in its own right.

G.3 The General Theorization of the Subject-Transformation Pattern

Verifying whether the Subject-Transformation Pattern observed in Case007, 008-A, and 009 recurs in other fields — medicine, the judiciary, local government, welfare, journalism, and so on. It will be established as a general theory only if reproducibility is confirmed.

G.4 Third-Party Verification

The current CSCE theory has developed under a particular research arrangement involving 久志さん, Claude, and ChatGPT. An independent third-party researcher should carry out a reproduction evaluation, examining whether there is self-evaluation bias, whether the theory is reproducible, and whether the evaluation procedure is objective.

G.5 Social Implementation

Applying the CSCE evaluation procedure in actual settings — institutions, corporations, education — to confirm whether the theory is operationally workable.

G.6 Refinement of Operational Definitions

Developing observable methods of measurement for indicators of confirmed agency (proposed: records of reasons for rejecting an AI proposal, records of reasons for correction, the rubber-stamp ratio, records of judgment responsibility, etc.), attainment criteria, and Judgment-Formation Coherence.

Appendix H — Revision History

Ver0.7 (from the empirical evaluation of Case001): reflects the following eight revisions.

No.	Content of Revision	Occasion of Discovery
①	Step 1 caution: made explicit the prohibition on using analytic concepts.	The contamination of "chilling effect" into the Observation Phase.
②	Step 2 caution: made explicit the deferral of comparative, causal, and outcome data.	The contamination of "possible divergence" and "voting-rate data."
③	Step 3: the four-layer × five-criteria analytic framework (Case000.6).	The problem of undefined objects and criteria of analysis.
④	Step 4: triangular comparison, five-way classification, prohibition of evaluative terms (Case000.7).	The problem of an undefined purpose and procedure for comparative analysis.
⑤	Addition, at the head of Chapter 6, of the theoretical position of comparative analysis (as a buffer layer).	Making explicit the three-stage distinction: analysis → comparative analysis → evaluation.
⑥	Modern-society evaluation: renaming "Negative" to "Non-Infringing."	The problem of confusing "non-infringing" with "negative" (Case001).
⑦	Step 7: recording discrepancies and unconfirmed matters in separate fields.	The problem of reclassifying Discrepancy 3 as an unconfirmed matter.
⑧	Evaluation template / preface: made explicit the recording of how the question changes, and the	The discovery, in Case001, of the deepening of the question.

	framing as "a device for discovering questions."

Appendix I — Correspondence Between CSCE and Major Western Theories

This appendix is offered for the international reader who wishes to situate CSCE within existing traditions of Western philosophy and social science. It is not a claim that CSCE derives from, replaces, or is reducible to any of these theories. Rather, CSCE is best understood as a research program that has developed independently — out of the Numa Theory of Japanese civil law and forty-five years of engineering practice — and that happens to converge with, and can usefully be placed in dialogue with, each of the following.

Western Theory	Point of Correspondence with CSCE	Point of Difference
Immanuel Kant (the Categorical Imperative, the Formula of Humanity)	Principle Zero — that a human being must never be treated merely as a means — corresponds to Kant's second formulation of the Categorical Imperative.	CSCE treats this not only as an ethical maxim but as an operational evaluand: it develops six observable indicators of objectification and a full evaluation procedure for detecting violations in institutions, not only in individual acts.
Karl Popper (falsifiability, piecemeal social engineering)	CSCE makes its own falsification conditions explicit (Chapter 4) and revises its propositions accordingly — the same commitment to testability that defines Popper's demarcation of science. Its incremental, case-by-case revision cycle also echoes Popper's preference for piecemeal over utopian social engineering.	CSCE sets falsification conditions not only for substantive claims about society (the Object Theory) but for its own evaluation procedure (the Method Theory) — a reflexive extension Popper did not develop in this form.
Imre Lakatos (research programs: hard core and protective belt)	Principle Zero functions as CSCE's unfalsifiable “hard core”; the propositions in Chapter 4 (the sequential ordering, the breakwater function, etc.) function as the falsifiable “protective belt” that absorbs revision without abandoning the core.	Lakatos described how theories survive anomalies; CSCE additionally institutionalizes the revision process itself as a manual procedure (the self-improving cycle of §1.3), rather than leaving it to the informal judgment of a scientific community.
Aristotle (practical wisdom, phronesis)	CSCE's insistence that judgment cannot be delegated to a fixed rule or to AI, and must be exercised by a responsible human being case by case, echoes Aristotle's account of practical wisdom as irreducible to rule-following.	Aristotle located phronesis in the character of the individual agent; CSCE is concerned instead with the institutional design that either cultivates or forecloses the exercise of such judgment at scale (Subject-Formation Coherence).
John Locke (natural rights, the person as property-holder)	CSCE's account of modern society — in which the individual is recognized as an independent Subject capable of holding property and entering contracts — corresponds to the Lockean picture of the rights-bearing person.	CSCE treats this Lockean stage as a necessary but insufficient “breakwater,” to be built upon rather than treated as a terminus, in the movement toward civil society.
Jean-Jacques Rousseau (the social contract, popular sovereignty)	Popular sovereignty and the rule of law, among CSCE's five criteria for modern-society evaluation, correspond directly to Rousseau's account of legitimate political authority.	CSCE adds to this a further, non-political axis — Subject-formation — asking not only whether sovereignty is popular in form, but whether citizens are, in practice, being formed into people capable of exercising it.
Jürgen Habermas	CSCE's “civil society” shares Habermas's	In the Anglo-American and Habermasian

(civil society, the public sphere)	concern with a domain oriented around human dignity and communicative reason, beyond the bare machinery of the state.	tradition, “civil society” typically names the associational sphere between state, market, and family. CSCE instead uses the term for a historical and normative stage beyond “modern society.” This terminological difference is substantive enough that it is flagged separately in the glossary, and readers are encouraged not to import the Habermasian sense by default.
Amartya Sen and Martha Nussbaum (the capability approach)	CSCE's insistence that a stated ideal be checked against whether it is actually realized — rather than merely proclaimed — mirrors the capability approach's distinction between formal entitlement and substantive capability.	Sen and Nussbaum work primarily at the level of individual welfare and development economics; CSCE applies a structurally similar test to institutions, corporations, and AI systems as evaluands in their own right.
Albert O. Hirschman (exit, voice, and loyalty)	One of CSCE's six indicators of objectification — absence of exit — corresponds directly to Hirschman's account of exit as a check on institutional power.	CSCE treats absence of exit as one indicator among six, to be weighed together with the others in a two-stage judgment, rather than as a standalone diagnostic.
Isaiah Berlin (value pluralism)	CSCE's explicit category of the “Value-Equilibrium Case” — in which the framework declines to rank competing values such as freedom and security — corresponds to Berlin's thesis that some values are genuinely incommensurable.	Where Berlin treats this pluralism as, in the end, a permanent condition of ethical life, CSCE treats it as a case type to be recorded and carried forward for further case-based evaluation, rather than as a closed philosophical conclusion.

This appendix will be extended as further correspondences are identified through Case Study work and through dialogue with readers and researchers trained in these traditions. Corrections and additions are welcomed as a form of the critique described in Chapter 9 of the companion Release Notes.

Appendix J — Intellectual Background of CSCE

Appendix I situated CSCE within a range of Western theories, theory by theory, in terms of correspondence and difference. This appendix takes a step back and offers a single, compact map of CSCE's intellectual lineage — including the Japanese civil-law tradition from which CSCE actually originates, alongside the Western thinkers with whom it most substantively converges. The purpose, again, is not to claim CSCE as derived from or authorized by any of these sources, but to show, in one view, what CSCE inherits from each and where its own development diverges.

Source	What CSCE Inherits	Where CSCE Is Distinctive
Numa Seiya (沼正也) — Japanese civil-law theory	Reading the entire Civil Code as a single system of thought organized around the human being, rather than as a sequence of independent provisions; the integration of freedom (property law) and protection (family law) as two halves of one design.	CSCE generalizes this civil-law reading of a legal code into an operational framework applicable to institutions, corporations, education, and AI generally — well beyond the scope of any single body of law — and adds a full evaluation procedure, operational definitions, and falsification conditions that legal theory alone does not require.
Immanuel Kant — the Formula of Humanity	The prohibition on treating a human being merely as a means, as the highest-order principle (Principle Zero).	CSCE converts this maxim of individual ethics into an institutional-evaluation procedure: six operational indicators of objectification, applied to institutions and systems rather than to individual acts of will.
Karl Popper — falsifiability	Falsifiability as the criterion distinguishing a scientific theory from a non-scientific one.	CSCE applies falsification conditions reflexively — not only to its substantive claims about society (the Object Theory), but to its own evaluation procedure (the Method Theory), and institutionalizes the revision cycle as a manual procedure rather than leaving it informal.
John Locke — natural rights, the rights-bearing person	The individual, recognized as an independent person capable of holding property and entering contracts, as the foundation of modern society.	CSCE treats this Lockean achievement as a necessary but provisional “breakwater” — a minimum condition to be built upon, not a terminus — on the way toward civil society.
Jean-Jacques Rousseau — popular sovereignty, the social contract	Popular sovereignty and the rule of law as grounds of legitimate political authority, among CSCE's five criteria for modern-society evaluation.	CSCE adds a further, non-political evaluative axis alongside political legitimacy: Subject-Formation Coherence — whether citizens are, in practice, being formed into people capable of exercising the sovereignty that is formally theirs.

Read together, these five sources trace the two paths that converge in CSCE: a forty-five-year engagement with a heterodox tradition of Japanese civil law, and independent contact — arrived at through that tradition, not borrowed from it — with several of the central problems of Western moral, political, and scientific philosophy. Appendix I develops the second of these paths in greater theoretical detail.

About the Author

Kushi Susumu (久志 進)

Proponent of Civil Society Control Engineering (CSCE).

At the Graduate School of Law, Toyo University, in the private-law program, he studied civil law and the theory of civil society under the late Professor Numa Seiya. He subsequently worked as a systems engineer and as an executive at an IT company, engaged in software development, systems design, and corporate management, gaining experience in both theory and implementation.

He is currently advancing research into Civil Society Control Engineering (CSCE), a new field of learning fusing legal studies, systems engineering, and AI.

CSCE systematizes:

- Principle Zero (human beings are not objects)
- the Three-Society Model (feudal society, modern society, civil society)
- the Five Criteria for Modern-Society Evaluation
- the Four Elements of Civil-Society Evaluation
- the Ten-Step Evaluation Procedure

and aims to analyze and improve human society, institutions, corporations, education, and AI under a common evaluative standard.

This book, the CSCE Evaluation Manual Ver1.0, was not completed by one person alone. Through the research of Case001 through Case010, it is a research achievement systematized collaboratively — positioning the generative AIs Claude and ChatGPT as companions to human intelligence, and repeating countless rounds of dialogue, verification, falsification, and reconstruction.

That said, responsibility for the theory, evaluative standards, structure, and the final adoption, correction, and settlement of the content presented in this book rests entirely with the author. Generative AI is a companion supporting thought — it is not the final judge. This division of roles itself embodies the principles CSCE holds central: Subject-formation and final judgment responsibility.

CSCE is not a completed theory. It is an ongoing empirical research program aiming at Case100. This book, too, is published as Ver1.0, and is expected to develop, through revision built on third-party verification and empirical research, into an Evaluation Engineering of greater reproducibility and universality.

Publication Information

Title: CSCE Evaluation Manual Ver1.0

Subtitle: — Official Evaluation Manual for Civil Society Control Engineering (CSCE) Evaluation Engineering —

Author: Kushi Susumu

Editorial Cooperation: ChatGPT, Claude

Format

Kindle e-book (independent publication); GitHub Pages public edition (open-archive edition)

Publication Date: July 16, 2026

Production

Author: concept · theory construction · execution of Case Studies · writing · editing · adoption decisions · final decisions

AI cooperation: organizing issues · organizing structure · comparative analysis · peer-review assistance · prose refinement · editorial support

Cover Design

Generated with AI-assisted tools (under the author's supervision)

Genre

Legal philosophy · Civil law · Civil-society theory · AI ethics · AI governance · Evaluation engineering · Civil Society Control Engineering (CSCE) · AI and society

Language: Japanese (this document: English edition)

ISBN: issued through Amazon Kindle

Sale: Amazon Kindle Store

Archive of Thought: Civil Society Control Engineering Archive (GitHub Pages)

Copyright Information

Copyright holder: Kushi Susumu

Author: Kushi Susumu

Publisher: Kushi Susumu (independent publication)

Publishing house: none

Printing and binding: not applicable (e-book)

Date of electronic publication: July 16, 2026

ISBN: issued through Amazon Kindle

Copyright © 2026 Susumu Kushi. All rights reserved.

The text, structure, evaluation procedure, evaluative standards, theoretical system, figures, terminology, conceptual organization, and original expression contained in this book are protected by copyright law.

In particular, the original structuring and systematization of the following are research achievements of the author, Kushi Susumu:

- Civil Society Control Engineering (CSCE)
- CSCE Evaluation Engineering
- Principle Zero (human beings are not objects)
- the Three-Society Model
- the Five Criteria for Modern-Society Evaluation
- the Four Elements of Civil-Society Evaluation
- the Ten-Step Evaluation Procedure
- Design Chain Integrity
- Subject-Formation Coherence
- Final Judgment Responsibility Coherence
- CSCE Meta-Analysis
- civil-society literacy
- the theory of the personal Subject
- the theory of human dignity

The thought, structure, text, figures, and editorial achievement of this book, including the above, belong to the copyright holder.

On Collaboration with AI

This book was produced through continuous dialogue, verification, and comparative analysis with the generative AIs ChatGPT, Claude, and Gemini.

AI has been used as a companion to human intelligence, responsible for organizing issues, organizing structure, comparative analysis, peer-review assistance, prose refinement, and editorial support.

However, AI is not a Subject of rights and duties. The thought, theory, evaluative standards, structure, adoption decisions, editing, expression, publication, and final responsibility for this book all rest with the author, Kushi Susumu.

Copyright in this book belongs solely to the author.

On Quotation and Research Use

This book welcomes quotation for research and educational purposes. When quoting, summarizing, or using this book for education or research, please do so appropriately within the scope of copyright law, and clearly cite the title and the

author's name.

Alteration that substantially distorts the intent of this book, unauthorized reproduction, and commercial use are not permitted.

Important Notice

The Nature of This Book

This book is the official evaluation manual systematizing the evaluation theory and evaluation procedure of Civil Society Control Engineering (CSCE). It is prepared on the empirical foundation of Case001 through Case010, with the purpose of enabling third parties to carry out evaluations following the same procedure.

This book is:

- not a book explaining the history of how the theory took shape;
- not a work of history;
- not a work of political thought;
- not intended to support or criticize any particular state, corporation, organization, or AI.

This book is a practical manual of Evaluation Engineering, systematizing what to evaluate and how to evaluate it.

The Purpose of This Book

The purpose of this book is to provide an evaluative system enabling observation, classification, analysis, evaluation, discrepancy-detection, and proposal to be carried out, under a common evaluative standard, for social institutions, policy, education, corporations, AI, and any other form of institutional design.

This book does not impose a single conclusion. Its purpose is to present an evaluative standard by which readers themselves, as personal Subjects, can observe, judge, and act on their own responsibility.

The Role of AI Cooperation

The production of this book made use of ChatGPT and Claude.

AI is a companion to human intelligence, responsible for supporting thought, comparative analysis, peer-review assistance, and editorial support.

The thought, theory, evaluation, adoption decisions, structure, publication, and responsibility, meanwhile, all rest with the author.

This is the book itself putting into practice the principles CSCE holds central: Subject-formation and final judgment responsibility.

Accuracy and Currency

This book organizes research achievements as of 2026. Legal studies, AI, social institutions, AI governance, and Evaluation Engineering are all continuing to develop. For this reason, the evaluative standards presented in this book, too, are not fixed. They will continue to be revised into Ver2.0 and Ver3.0 as case studies accumulate.

This Book Is Ver1.0, Not a Finished Work

CSCE is not a completed theory. Ver1.0 was established through Case001–Case010, but this is a research program that will continue to develop, aiming at Case100, through the accumulation of falsification, verification, third-party evaluation, and confirmation of reproducibility. This book, too, is published as one volume in that process.

The Author's Approach to Publication

The author does not present this book as an absolute correct answer. It is presented as an evaluative standard for observing society, protecting human dignity, and cultivating the personal Subject.

What CSCE aims at is not entrusting society to AI. It is that human beings, using AI as a companion to intelligence, think, judge, and bear responsibility as personal Subjects, and build a better civil society. This book is the first official manual systematizing that ideal as Evaluation Engineering.

Disclaimer

This book compiles the author's research achievements concerning legal studies, social thought, AI ethics, AI governance, and Civil Society Control Engineering (CSCE). It does not constitute legal advice, investment advice, management advice, policy recommendation, administrative judgment, or an established academic consensus.

The evaluation results and analysis presented in this book are one evaluative framework for understanding society. Actual decision-making, legal judgment, policy judgment, management judgment, and any other final judgment should be made at the reader's own responsibility.
